

HW-484 Magnetic Switch Module (Reed Switch)

This sensor detects the **presence of a magnet**. When a **magnet comes near** the glass-encased reed switch on the module, the contacts inside **close**, sending a signal. It's often used for **detecting door open/close**, **security systems**, or **robot triggers**.

Pin Description:

Pin	Function
VCC	Power (3.3V/5V)
GND	Ground
DO	Digital Output

Sensor type: Dry Reed Switch

Power: 3.3V to 5V

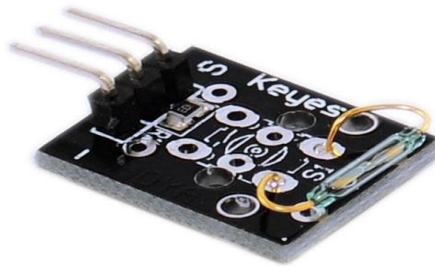

Output:

- **DO (Digital Output):** Goes LOW when magnet is near
- **AO (Analog Output):** Not always present, depends on the version

LED indicator: Lights up when the switch is triggered

HW-497:

Mini Magnetic Reed Switch Module:

The KY-021 Magnetic Reed Switch module is a switch that is normally open and gets closed when exposed to a magnetic field, sending a digital signal. Commonly used in mechanical systems as proximity sensors.

Uses the **Hall effect** to detect magnetic fields generated by current.

PIN DESCRIPTION:

KY-021	Arduino
S	Pin 2
middle	+5V
—	GND

OPERATING VOLTAGE – 3.3V to 5V
